1. Field of the Invention The present invention relates to a device which is capable of blowing air on a region of a subject to be treated, and in particular, a device which is capable of blowing air on a region of the face and/or the neck to effectively prevent the dryness of the skin in an energy-saving manner.

2. Description of the Related Art Conventionally, in a system for drying the skin, a device used to blow air on the skin is called a blow-dryer, which uses a motor. The rotational power of the motor is converted into heat and used to heat air. The heated air is then blown against the skin to evaporate moisture on the skin. FIG. 6 is a cross-sectional view showing a blow-dryer of the type described. In FIG. 6, reference numeral 10 denotes a blow-dryer; 1 denotes

a hood part; 12 denotes a body which drives a blower and is supported by the hood part 1; and 11 denotes a plurality of blow pipes. The blow pipe 11 is inserted into an electric heating unit (not shown), and the blower 12, which is made of an electric motor and the like, is driven by an electric power supplied from the
